Embedded C++ AutoCAD also includes a C++ class library, AutoCAD C++. This library can be used to automate AutoCAD. It is based on the Metrowerks C++ standard library. It can be used to create dynamic drawing components and 3D objects. It has functions to obtain a variable's value, to register variables, and to get variables' types. It allows the creation of an event handler. It allows the setting of the active drawing or of a specific drawing. It can create new variable or existing variable in a drawing. It allows modifying existing drawing components or variables. It allows saving drawing components and existing drawing objects. It can export selected drawing components to DXF format. It can import selected DXF files. It can export selected drawing objects to DWG format. It can import selected DWG files. It can export selected drawing objects to 3D DWG format. It can import selected 3D DWG files. Interface description The interface of the program consists of four major areas: Drawing area The drawing area in AutoCAD provides tools for navigating and viewing various types of objects. The area can be maximized so that it fills the entire screen, or it can be reduced so that it occupies only a portion of the screen. It is also possible to toggle the mode between two different sizes. When the area is maximized, the function keys are not available. It is possible to navigate to a specific area of the drawing by using the Arrow Keys, Page Up and Page Down keys, and by using the Zoom dialog. It is possible to rotate the drawing by using the R key. The following command buttons allow navigation to different areas of the drawing. Previous/Next workspace The New Workspace command is available from the application menu bar. This command allows changing the currently displayed workspaces. The workspaces can be displayed horizontally or vertically. There are five workspaces available. It is possible to toggle between these workspaces by using the S key. Save The Save command allows saving the current state of the drawing. This command is available from the application menu bar and from the File menu. Description of the Related Art For various purposes, a server may present advertisements to users in response to queries that are issued by the users. For example, a user may issue a query including search terms in order to search for information on the World Wide Web. The server may then present advertisements in response to the query. In addition, the server may further present advertisements in response to the user's actions, such as accepting an advertisement, clicking on an advertisement, and so on. In known systems, the advertisements are usually presented to the user by way of hyperlinks that are displayed with the query. For example, advertisements for items (e.g., items on Amazon.com) are displayed to a user that issues a query that includes one or more search terms for the item.
