A: An easy solution is to store the data in a file. Have a look at this question which talks about how to store files in the main application directory. Once you have access to that directory you could write your own application in .NET that runs on a Windows machine and on Windows Mobile, iPhone, Android, etc... The application can store the files to a local file on the device or to an email or some other network location. This solution is based on the fact that Windows mobile and other mobile devices have a limit on the number of files that can be stored in the memory on the device. If you are writing a Windows application then it can be done by reading the file with a FileStream and then writing to the device memory as needed. This is well documented in other questions on Stack Overflow about writing to files (here, here, here, etc...). Edit: After re-reading the question, it looks like the OP is only interested in listing files in the application directory on the Windows Mobile device... Q:

what is the use of type="text/css"? What is the purpose of adding a type="text/css" in an tag. Example: body { margin: 0; padding: 0; width: 100%; height: 100% } A: It is for backward compatibility, to be used when an old browser does not support the type= attribute. I suspect the browser will not actually call it, but if the user's browser does not support the CSS3 attribute, the old-style will still work. A: it was written so that old browsers would understand it. For example in ie7 even though the css is read its not applied. it was written with this in mind. you could possibly just have a link

DESCRIPTION (Applicant's abstract): The P.I. and Co-P.I.'s of this project have an extensive knowledge of the primary and secondary metabolites of the model cyanobacterium *Synechococcus* sp. PCC 7335. From previous studies, the P.I. and Co-P.I. proposed that unique post-translationally modified and structurally complex carotenoids exist in this cyanobacterium which serve as oxygen scaven
